# — CONVENTIONS - Ruby on Rails

https://pragmaticstudio.com

http://localhost:3000/events

http://localhost:3000/movies

Controller names are plural. The action to list things is named index.

**EventsController MoviesController** 

index

index

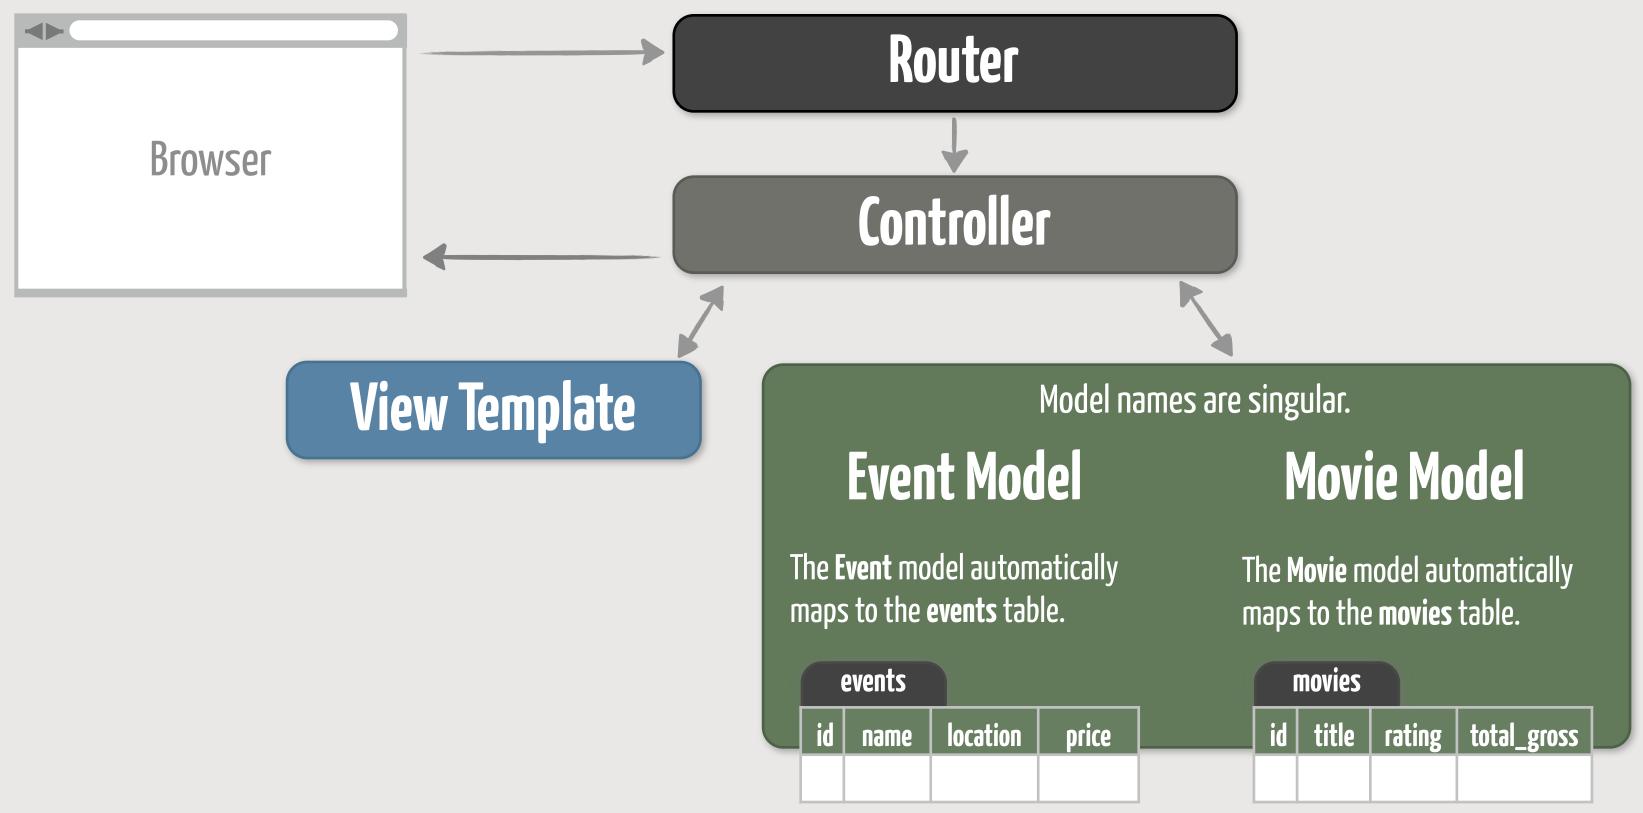

When you don't explicitly tell the action which view template to render, it looks for one with the same name as the action.

**View Template** 

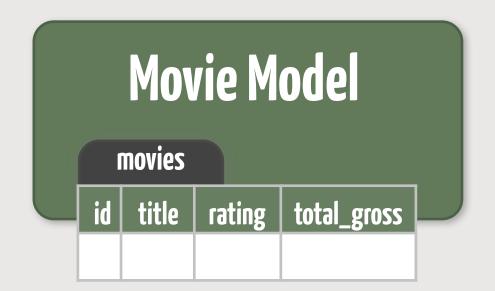

index.html.erb

Index Page

Database table names are plural.

Name your migration using the format **AddXXXToYYY**, and Rails will assume you want to add the listed column names and types to the YYY table. (The XXX part is arbitrary.)

rails g migration AddFieldsToEvents description:text starts\_at:datetime

rails g migration AddFieldsToMovies description:text released\_on:date

	events						
id	name	location	price	description	starts_at		

Migration Names

http://localhost:3000/events/1 http://localhost:3000/movies/1

### Router

Show pages map to the show action in the controller.

# **EventsController MoviesController**

show

show

When you don't explicitly tell the action which view template to render, it looks for one with the same name as the action.

# **View Template**

show

Show Pages

The helper that generates a URL path to the **index** action is **plural** because we're dealing with **multiple** things, such as multiple events or movies.

events\_path
event\_path
name

GET GET HTTP verb /events(.:format)
/events/:id(.:format)

URL pattern

events#index events#show

Controller#Action

The helper that generates a URL path to the **show** action is **singular** because we're dealing with **one** thing, such as one event or movie.

Route Names

http://localhost:3000/events/1/edit http://localhost:3000/movies/1/edit

#### Router

By convention, the route name for editing a form is edit\_

edit\_event GET /events/:id/edit events#edit
edit\_movie GET /movies/:id/edit movies#edit

By convention, the action name for editing a form is edit.

EventsController MoviesController

edit

edit

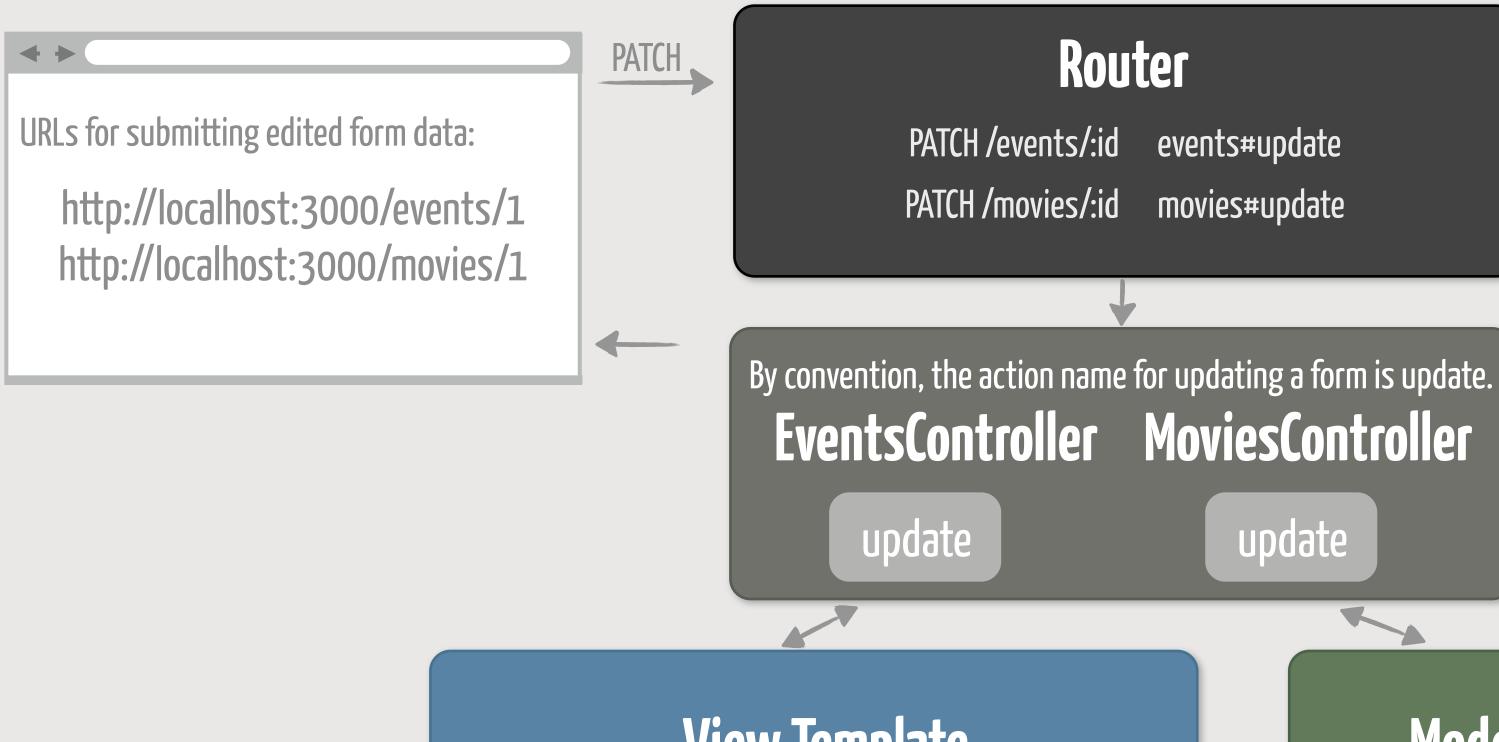

By convention, the view name for editing a form is also edit.

**View Template** 

edit

Model

**Edit Form** 

View Template show

Model

Submit Edited Form

http://localhost:3000/events/new

http://localhost:3000/movies/new

## Router

new\_event GET /events/new events#new

new\_movie GET /movies/new movies#new

By convention, the action name for a blank form is new.

**EventsController MoviesController** 

new

new

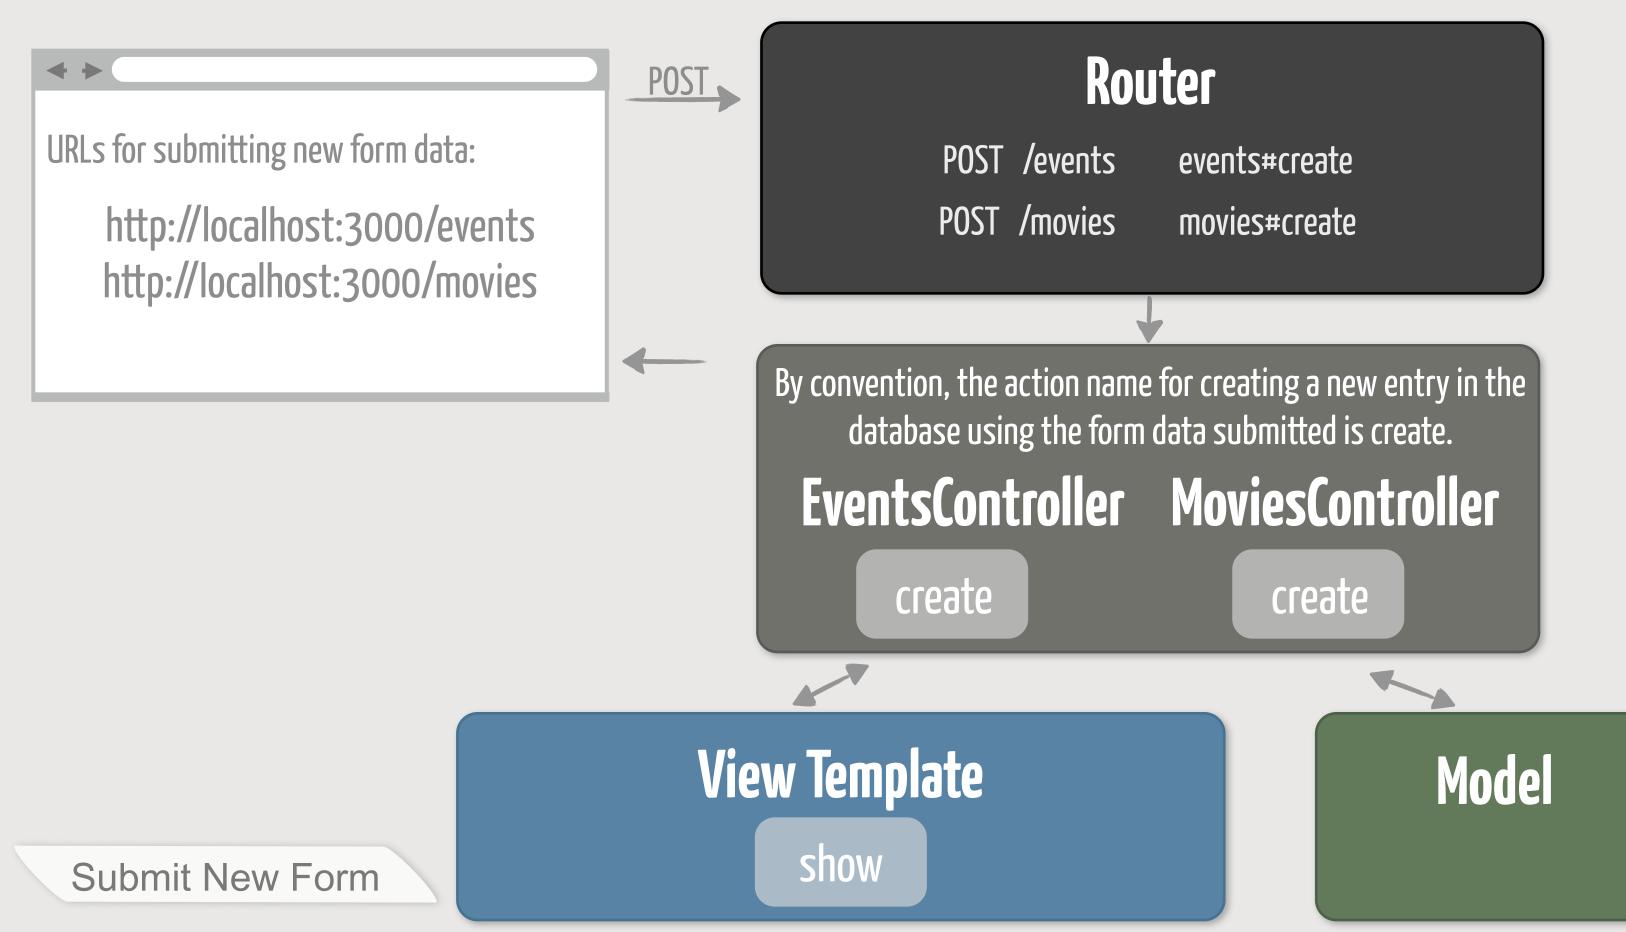

By convention, the view name for a blank form is also new.

**View Template** 

new

Model

**New Form** 

URLs for deletion from database:

http://localhost:3000/events/1 http://localhost:3000/movies/1

DELETE

### Router

DELETE /events/:id(.:format) e

events#destroy

DELETE /movies/:id(.:format)

movies#destroy

By convention, the action name for deleting an entry in the database is destroy.

**EventsController MoviesController** 

destroy

destroy

**View Template** 

Model

Delete

# resources: events

Helper	HTTP Verb	URL Pattern	Controller#Action
events_path	GET	/events	events#index
event_path	GET	/events/:id	events#show
edit_event_path	GET	/events/:id/edit	events#edit
	PATCH	/events/:id	events#update
	PUT	/events/:id	events#update
	POST	/events	events#create
new_event_path	GET	/events/new	events#new
	DELETE	/events/:id	events#destroy

# **RESTful Conventions**

to read things **GET PATCH** to update (partial) things to create things **POST** to update things PUT to remove things DELETE

# Route Helper Methods

events\_path<br/>event\_pathGET<br/>GET/events<br/>/events/:idevents#index<br/>events#showhelperHTTP<br/>verbURL patterncontroller#action

Helper Method	Generates
events_url	http://www.example.com/events
events_path	/events
event_url(id)	http://www.example.com/events/1
event_path(id)	/events/1

# **Event Model**

events

id	name	location
1	BugSmash	Denver, CO
2	Hackathon	Austin, TX
3	Kata Camp	Dallas, TX

# Registration Model

class Registration < ApplicationRecord
belongs\_to :event
end</pre>

#### registrations

id	name	email	event_id
1	Larry	larry@stooges.com	1
2	Moe	moe@stooges.com	1
3	Moe	moe@stooges.com	3

The entity on the "many" (child) end needs a foreign key referencing the entity on the "one" (parent) end.

The name of this foreign key needs to be the name of the "one" (parent) entity, followed by "\_id".

One-to-Many

# **Event Model**

```
1 *
```

# Registration Model

```
class Registration < ApplicationRecord
  belongs_to :event
end</pre>
```

#### event.registrations

Returns an array of Registration objects that are associated with the event: all the registrations that have an event\_id matching the event's ID.

#### registration.event

Returns the Event object associated with the registration: the event that matches the ID in the event\_id column.

Put as much **business logic** into the model as you can.

#### **Event Model**

```
def free?
 price.blank? || price.zero?
 end
def spots_left
  capacity - registrations.count
 end
def sold_out?
  spots_left.zero?
 end
```

#### **Movie Model**

```
def flop?
  total_gross.blank? || total_gross < 50000000
  end

def average_stars
  reviews.average(:stars)
  end</pre>
```
